Research project title: Collection and Evaluation of Modal Traffic Data for Determination of Vehicle Emission Rates under Certain Driving Conditions

16. Abstract

This report documents a summary of all the emission data that were collected from five highway locations in the city of Houston for the TxDOT Research Project # 0-1485 titled "Collection and Evaluation of Modal Traffic Data for Determination of Vehicle Emission Rates under Certain Driving Conditions." The five highway locations for the emission collection include two on-ramps, two off-ramps, and one surface street. One of the on- and off-ramps was on a slight uphill grade while the other one of each was on a slight downhill grade. The remote emission sensor SMOG DOG was used to collect emission concentrations of CO, HC and NOx, and to simultaneously record a vehicle's instantaneous speed and acceleration rate. A total of 4628 emission data were recorded.

A detailed documentation of this research project can be found in the Report 1485-1 and 1485-3F.

IMPLEMENTATION STATEMENT

This report documents the on-road emission data collected from five highway locations in the city of Houston for the project 0-1485 entitled "Collection and Evaluation of Modal Traffic Data for Determination of Vehicle Emission Rates Under Certain Driving Conditions." The Implementation Statement for this project can be found from the Report 1485-1.

The United States Government and the state of Texas do not endorse products or manufacturers. Trade or manufacturers' names appear herein solely because they are considered essential to the object of this report.

ACKNOWLEDGMENTS

The author would like to express his sincere gratitude for the support and valuable comments that he received from Project Director Mr. Stanley W. Burrier, P.E., Director of Transportation Analysis, Traffic Analysis Section, Transportation Planning and Programming Division, Texas Department of Transportation through the course in completing this project. The author would also like to express his thanks to the Project Advisory Committee and other TxDOT personnel for any direct or indirect assistance that he received.

The author expresses his sincere thanks to Dr. Naomi W. Lede', Executive Director of Center for Transportation Training and Research for her generous support and contribution to this project. The author would like to thank all personnel of Center for Transportation Training and Research (CTTR) at Texas Southern University (TSU) who have directly or indirectly contributed to this project or have provided various assistance.

SUMMARY

This reports documents a summary of all emission data that were collected from five highway locations in Houston for the TxDOT Research Project 0-1485 titled "Collection and Evaluation of Modal Traffic Data for Determination of Vehicle Emission Rates under Certain Driving Conditions." The five highway locations for the emission collection include two on-ramps, two off-ramps, and one surface street. One of on- and off-ramps was on a slight uphill grade while the other one of each is on a slight downhill grade. The remote emission sensor SMOG DOG was used to collect emission concentrations of CO, HC and NOx, and to simultaneously record a vehicle's instantaneous speed and acceleration rate. A total of 4628 emission data were recorded.

A detailed documentation of this research project can be found in the Report 1485-1 and 1485-3F.

CHAPTER1 : INTRODUCTION

In order to accomplish the objectives established in the Research Project 0-1485, Collection and Evaluation of Modal Traffic Data for Determination of Vehicle Emission Rates Under Certain Driving Conditions, the emission data were collected from five highway locations in the city of Houston. The remote vehicle emission sensing equipment is used as a tool in the data collection. The author suggests readers to refer Report 1485-1 for the background information of this research.

Data Collection Equipment: Remote Emission Sensor

The RES that is used in the vehicle emission data collection is called SMOG DOG (SBRC, 1995 and Jack et al, 1995), which was developed by the Santa Barbara Research Center (SBRC), a wholly owned subsidiary of Hughes Aircraft Company. It is an application of advanced technology developed for environmental monitoring from space to accurate measurement of automotive emissions on earth. It was initially developed for providing a cost-effective tool for screening for high emitter vehicles and has experienced many successful applications in Arizona, California, North Carolina, Alaska, Georgia, and New Mexico. Some other states are also starting to use RES to reduce automobile pollution.

The SMOG DIG, which consists of a sensor head, source, video camera, and state-of-the-art electronics for capture, display, and storage of both image data (automobile license plates) and vehicle emission data, uses a remote sensing technique that has been used for many years for satellite monitoring of ecological and environmental points of interest like earth's atmosphere and forest. In its vehicle emission sensing, infrared "light" is passed through a vehicle's exhaust plume and is absorbed by the different gases in the plume. The sensor determines changes in the selective absorption of infrared radiation by molecular vibrational modes at wavelengths specific to the pollutant; i.e., HC, CO, NOx, and CO_2. Changes are measured using chemically specific detectors which sense radiation only at these wavelengths. The motion of a vehicle through the beam triggers the simultaneous measurement of CO, HC, NOx, and CO_2 in the dispersing exhaust cloud for a user-selectable period (typically one second). The data from all four pollutants are analyzed in a real time and the results, expressed as a percentage of the exhaust, are stored on computer disk. The image data is stored on a VCR tape, which can be read by an operator and the license plate information is entered into the same file as the emission data.

The SMOG DOG can identify the high-emitting vehicles, and owners of these cars can then be notified that their cars are polluting and are encouraged to repair the cars. Because the SMOG DOG continuously samples the emission from vehicles on the road, a high-emitting vehicle will likely be identified and repaired. In this way, a dirty vehicle will have less of a chance of being driven and polluting the air. The SMOG DOG is non-obtrusive to drivers. The test is performed unknown to the driver in a fraction of a second as the vehicle passes by the sensor without having to slow down and increase traffic.

Thus, it is a very cost-effective means of reducing air pollution. It can screen thousands of vehicles per day at a relatively low cost.

A special feature of the SMOG DOG system is its enhancement of the capability in detecting a vehicle's speed and acceleration rate. The instantaneous speed value and acceleration rate of a vehicle passing through the test site are monitored utilizing piezo strips and a computer. Speed and acceleration data are then transferred to the main system computer and stored with the vehicle records. The simultaneous measurements of emissions, speed and acceleration rate provides an opportunity to establish a relationship between the emissions and a vehicle's instantaneous speed profile.

Data Collection Site Selection

A number of factors are considered in determining where the emission data should be collected. First, emission data should be collected for a wide range of speeds and acceleration rates in order to more accurately establish the relationship between the emission rate and a vehicle's speed profile. In this consideration, freeways can be used to collect emission data for high speeds, while the signal controlled streets can be used to collect emissions of vehicles at lower speeds. An on-ramp location is ideal for collecting emissions at acceleration mode while an off-ramp location suited to collect emission of vehicles that decelerate. Second, emission data should be collected for diverse geometric conditions in order to determine how geometric conditions influence the vehicle exhaust emissions. To this end, various highway sites of at-grade, up-hill grade, and down-hill grade should be included. Finally, the safety of the equipment operator of the SMOG DOG should be considered. The current version of the SMOG DOG requires the equipment operator to walk cross the highway several times in setting up the emission sensor, laying out the piezo strips across the pavement, and calibrating the entire emission sensing system before the actual emission collection can be conducted. Therefore, setting up the system onto a multiple lane freeway or major arterial location places the equipment and operator at a high safety risk.

With all of the above considerations in mind, many locations in the city of Houston were evaluated and finally five highway locations were earmarked for the emission data collection. Of the five locations, two are on-ramps, two are off-ramps and one is on a signalized street. For the on-ramp and off-ramp locations, one of each is on a slight uphill grade while the another one of each is on a slight downhill grade. While the vehicle emission data for an idling mode should also be collected for the completeness of the emission data set, the operation of SMOG DOG requires that the vehicle must be in motion. Hence, the on-road emission data for the idling mode are not able to be collected in this research. The selection of only five locations for emission data collection may not be ideal, because many traffic and geometric conditions are not included. For example, it would be ideal to include highways with various uphill and downhill slopes, as opposed to only two uphill and downhill distinctions. Also, various traffic conditions such as vehicles in front of a traffic signal, vehicles after a traffic signal, platoon dispersion vehicles, free driving vehicles, vehicles at merging areas, vehicles at diverging areas, etc.,

should all be included. However, the scope of this research project in terms of the funding has limited the emission collection designs to five highway locations. In fact, considering the cost in using the SMOG DOG service, the scope of this research can only support the emission collection for five days.

Considering the time for setting up the SMOG DOG equipment and the need for collecting sufficient emission data for each location, it is not practical to collect emissions for more than one location on each day. Therefore, five highway locations were selected for collecting emissions and each location was collected for an entire day. The actual emission data collection work were conducted during the period of April 29 to May 3, 1996. Table 1-1 illustrates the list of locations that were selected for the data collection as well as the actual date that each collection exercise was conducted.

Table 1-1: List of emission data collection locations in the city of Houston

#	Location	Characteristics	Collection Data
1	Holcombe & Yellowstone Blvd. Onto the I-288 Southbound	On-ramp with approximately 150 meters long and a 3-4 percent downhill grade	April 29, 1996
2	Reed Rd. Onto I-288 Northbound	on-ramp with approximately 250 meters long and a slight uphill grade	April 30, 1996
3	I-288 Southbound off to Reed Rd.	Off-ramp with approximately 250 meters long and a slight downhill grade	May 1, 1996
4	I-288 Northbound off to Yellowstone & Holcombe Blvd.	Off-ramp with approximately 150 meters long and a 3-4 percent uphill grade	May 2, 1996
5	Almeda Rd. Northbound between Holly Hall Rd. and El Paseo	Signal controlled surface street with a level grade	May 3, 1996

It should be noted that all the emission data collection using the SMOG DOG did not consider the effect of cold start and hot start conditions of vehicles, although it is equally important to consider these factors in evaluating the existing emission estimation capabilities, as all the emission factor models have considered these conditions as proportional contributors to the entire emissions. The emission data collected in this research are considered to represent the emissions under hot stabilized mode of vehicles.

On-Road Emission data Collection

The on-road emission data were collected from the five locations selected above with the assistance of a technician from the SBRC. The final products of this emission collection efforts include standard ASCII files which include emission concentration percentages and speed and acceleration data, hourly updates on ambient temperature and humidity, license plate TIF files, and video tapes of the rear of vehicles with emission data superimposed.

As an illustration of the remote emission sensor SMOG DOG, three photos were taken during the emission data collection. In the following Figure 1-1, the equipment on this side of the on-ramp pavement is the source, the other side has the sensor head, and the piezo strips are shown on the pavement surface. Figure 1-2 shows the video camera which was set on the back of the SMOG DOG system. Figure 1-3 illustrates the van within which the entire computer system is built and connected with other equipment.

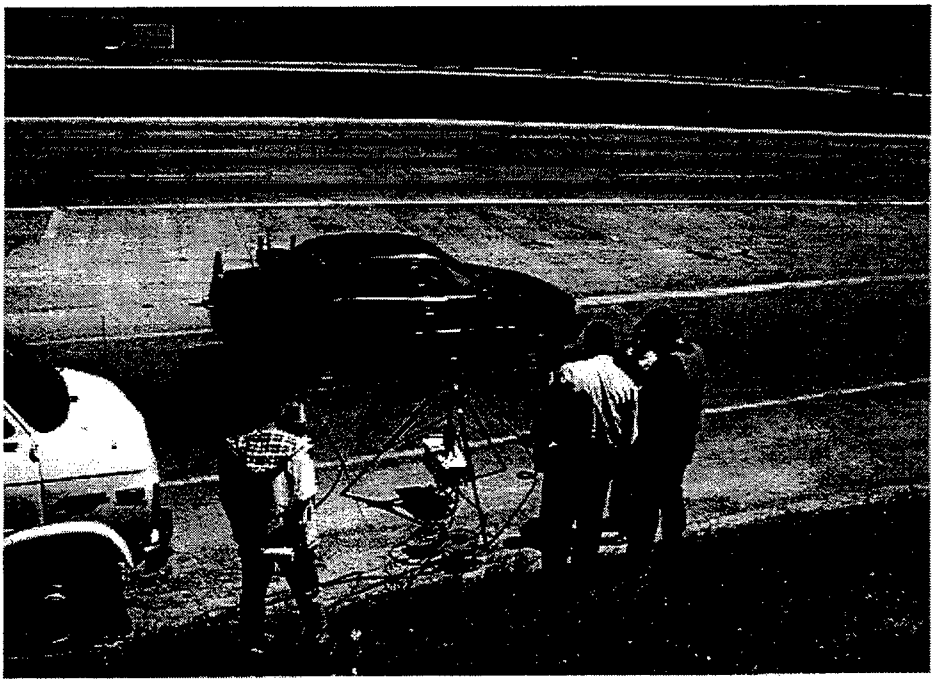

Figure 1-1: Illustration of source, sensor head and piezo strips during emission data collection

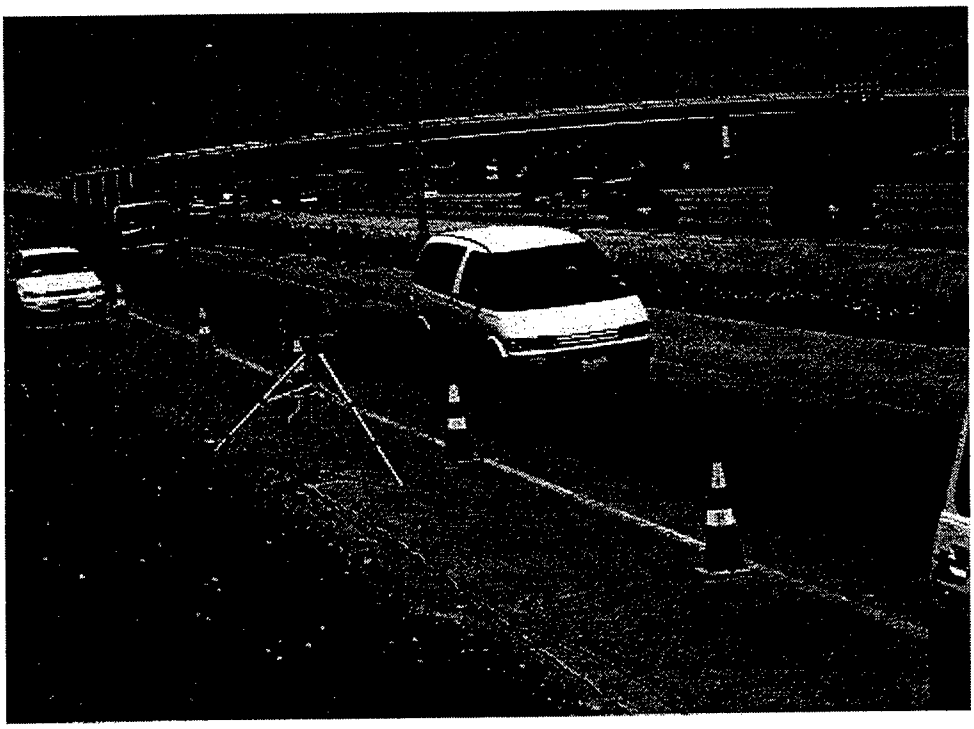

Figure 1-2: Illustration of video camera location during emission data collection

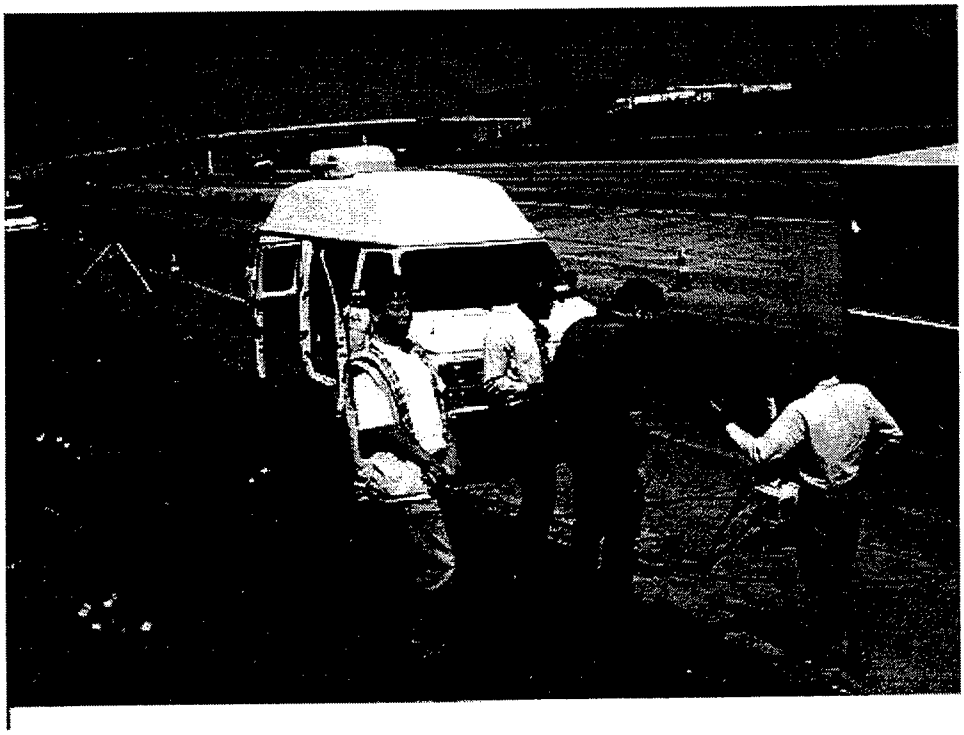

Figure 1-3: Illustration of the van which includes the entire computer system during emission data collection

In the end, the on-road emission data collection resulted in a total of 1062 data samples for Location 1, 828 data samples for Location 2, 1000 data samples for Locations

3 and 4, and 738 data samples for Location 5. Chapters 2 to 6 provide a summary of the collected emission data for each day. The following Table 1-2 interprets the meaning of each column in the collected emission data file in Appendix E.

Table 1-2: Collected emission data file header

Column	Interpretation	Column	Interpretation	Column	Interpretation
1	Vehicle No.	8	HC%	15	Speed 2
2	Date	9	Slope CO	16	Acceleration Rate
3	Time	10	Slope HC	17	NOx%
4	Sensor No.	11	Max CO_2	18	Slope NOx
5	License Plate No.	12	Max CO	19	Max NOx
6	CO%	13	Max HC		
7	CO_2%	14	Speed 1		

In this research, the emission concentrations of CO, HC, and NOx in Columns 6, 8, and 17, and the speed and acceleration data in Columns 14-16 will be used. Columns 9-13 and 18-19 are useful in the derivation of emission concentrations within the SMOG DOG computer processing and will not be directly used in this research. Interested readers can find more detailed description about these columns from the reference SBRC (1985).
