

## Acknowledgments

The principal investigator of these studies (Raymond Kiefer) would like to acknowledge the major contributions of fellow CAMP member Mel Palmer. Mel took lead (and a large amount of working level) responsibility for overseeing the build and validation testing of the surrogate lead vehicle target, the development of the data acquisition system and data reduction software, and the implementation of the various crash alert interfaces. (Mel provided descriptions of each of these items in this report.) Ray would also like to acknowledge fellow CAMP member, David LeBlanc, who took lead responsibility for the critical task of translating the crash alert timing approach developed from CAMP Study 1 into equations that could be implemented into the data acquisition system, and for developing these equations to address various kinematic scenarios beyond the closing scenarios considered in Study 1.

CAMP would also like to express special thanks for the outstanding subject running, data reduction, report preparation, and manuscript review support provided by Marie Cassar of Design Research and Analysis. In addition, CAMP gratefully acknowledges her outstanding efforts in conducting and documenting the questionnaire and laboratory studies involved in down-sizing the visual alert display format and alert sounds which were eventually tested in the three interface studies. CAMP would also like to acknowledge Carol Flannagan for her efforts in the statistical analysis of these data, and most notably, for her important contribution in developing the required deceleration equation used for crash alert timing purposes in these driver interface studies via modeling of the Study 1 (baseline) data.

CAMP would also like to express sincere gratitude to the General Motors Special Test Group drivers, Guy Mesclier, Eric Sorenson, Thesia Wolf, Fred Ortiz, and Matt Abramowicz. These drivers made an invaluable contribution to the success and safe execution of this project. We would also like to thank the countless folks at the General Motors Milford Proving Ground who supported/enabled this project, most notably Dick Blades, Jim Cole, Gary Manross, Stan Lada, Vicki Farmer, Mike Atkinson, and Jim Gutting.

Finally, CAMP also gratefully acknowledges some of the following “key” contributors who performed contract work under CAMP direction: Roush Industries, Inc. for developing the surrogate target, VI Engineering for upgrading the data acquisition system, ITT Industries for developing the POV brake controller, MOR-Pace International for their subject recruiting/scheduling efforts, and Mary Jean Babic of ArborComm Inc. for report preparation support.
